

Optimum Broadband

Broadband that means business

A slow internet connection can be extremely frustrating for busy companies, as it reduces the productivity of the workforce, costing unseen time and money. Many businesses are unaware of how slow and inconsistent their connection speeds are until they find out how good Optimum Broadband is.

What are the benefits?

- Save time and money by increasing employee productivity with dedicated bandwidth
- Open up the possibilities of cloud computing and networking
- Centralise your connections by creating an MPLS network for satellite offices or home workers
- No restrictions on usage unlike many other broadband connections where a usage limit is imposed.
- Industry-leading service level agreement (SLA) gives you the assurance that you will always receive the best fix times and levels of support available on broadband.
- Assured 512Kbps bandwidth for prioritisation of data or voice traffic.

It's great for businesses requiring a back-up service for their existing Ethernet connection and for companies in need of a business-grade broadband service.

How does it work?

Optimum Broadband works by enhancing existing broadband technology to provide a fixed level of assured bandwidth for your business. It also comes with a service level agreement to bring you additional confidence and peace of mind.

Will I be able to get it?

In the majority of cases if you have business premises with a telephone line you can benefit from Optimum Broadband. One of our team will be happy to advise on how Datasharp Optimum Connect can make business better for you.
